PRIMARY CELL SOLUTIONS®

Primary cell cultures closely mimic the physiological state of cells in vivo and generate relevant data representing living organisms.

ATCC Primary Cell Solutions is a system of matched components designed to boost growth, maximize functionality, and maintain normal morphology for each primary cell type. The combination of an optimized basal medium and cell-specific growth kits is a crucial element in the ATCC Primary Cell Solutions product line. Each set is designed to eliminate the guesswork involved with finding just the right complement of growth factors to support and promote cell proliferation and the expression of relevant biomarkers for each cell type – a complete lab tested “solution” to your primary cell culture needs.

ATCC Primary Cells are well characterized, having undergone tests for sterility and viability. In addition, primary cells are produced under controlled isolation and processing protocols, which minimizes intra-lot variation and provides cells with maximal and consistent performance. ATCC Technical Services can provide additional donor information to aid in selecting the most relevant primary cell lots to guarantee the optimal outcome for your experiments.

ATCC Primary Cell Solutions basal media and growth kits have been quality tested for sterility and performance tested with each respective cell type to ensure that the vital needs of the individual culture are consistently met. Supplementation of the basal media with an appropriate growth kit is essential in creating an optimal growth environment for cellular response.

PRIMARY CELLS, SUPPORTING MEDIA, AND GROWTH KITS

The table below is organized by cell type and includes the number of cells that are contained in each vial of primary cells. Also in the table, the product numbers of matched basal media and growth kits are provided for ease of ordering as well as to ensure the optimal growth and performance of your primary cells.
